Experiment -1

AIM: To create an AWS free tier account to provision the resources.

Description:

Amazon Web Services (AWS) is a cloud computing platform that provides services such as computing power, storage, and databases over the internet. An AWS account gives users access to the AWS Management Console, where they can create and manage cloud resources. The AWS Free Tier provides eligible new customers with limited free usage or credits for selected services, subject to the current offer, service limits, and terms. In this experiment, an AWS account is created and the console is opened to prepare for provisioning cloud resources.

Steps:

1. Open a web browser and visit the official AWS website: https://aws.amazon.com/.

2. Select “Create an AWS Account” and enter a valid email address, account name, and password.

3. Verify the email address using the verification code sent by AWS.

4. Enter the required contact information and choose the appropriate account type.

5. Provide the requested payment-card details for account verification. Check the current AWS terms; a payment method may be required even when using eligible Free Tier offers.

6. Complete the identity verification process using the method provided by AWS.

7. Choose a support plan. Review the plan details and select the option appropriate for the lab; avoid selecting paid support unless required.

An AWS account was created successfully and access to the AWS Management Console was obtained. The account is ready for provisioning eligible cloud resources. The available Free Tier benefits and usage limits should be checked in the Billing and Cost Management console before creating resources.

Result: Thus, an AWS account was created to provision cloud resources.

8. Sign in to the AWS Management Console using the new account credentials.

9. Open the Billing and Cost Management console and review Free Tier usage, billing information, and available budget or billing-alert options.

10. Search for an eligible AWS service, review its Free Tier limits and pricing, and proceed to create a resource only when instructed by the lab.

11. After the experiment, stop or delete any resources that are not needed and check the billing dashboard to avoid unexpected charges.

Output:
